

TG mutant RAS neoantigen vaccine

Dr. Erik Digman Wiklund, CBO

RAS Targeted Drug Discovery Summit
Boston, 18 September 2019

targovax

IMPORTANT NOTICE AND DISCLAIMER

This report contains certain forward-looking statements based on uncertainty, since they relate to events and depend on circumstances that will occur in future and which, by their nature, will have an impact on the results of operations and the financial condition of Targovax. Such forward-looking statements reflect the current views of Targovax and are based on the information currently available to the company. Targovax cannot give any assurance as to the correctness of such statements.

There are a number of factors that could cause actual results and developments to differ materially from those expressed or implied in these forward-looking statements. These factors include, among other things, risks or uncertainties associated with the success of future clinical trials; risks relating to personal injury or death in connection with clinical trials or following commercialization of the company's products, and liability in connection therewith; risks relating to the company's freedom to operate (competitors patents) in respect of the products it develops; risks of non-approval of patents not yet granted and the company's ability to adequately protect its intellectual property and know-how; risks relating to obtaining regulatory approval and other regulatory risks relating to the development and future commercialization of the company's products; risks that research and development will not yield new products that achieve commercial success; risks relating to the company's ability to successfully commercialize and gain market acceptance for Targovax' products; risks relating to the future development of the pricing environment and/or regulations for pharmaceutical products; risks relating to the company's ability to secure additional financing in the future, which may not be available on favorable terms or at all; risks relating to currency fluctuations; risks associated with technological development, growth management, general economic and business conditions; risks relating to the company's ability to retain key personnel; and risks relating to the impact of competition.

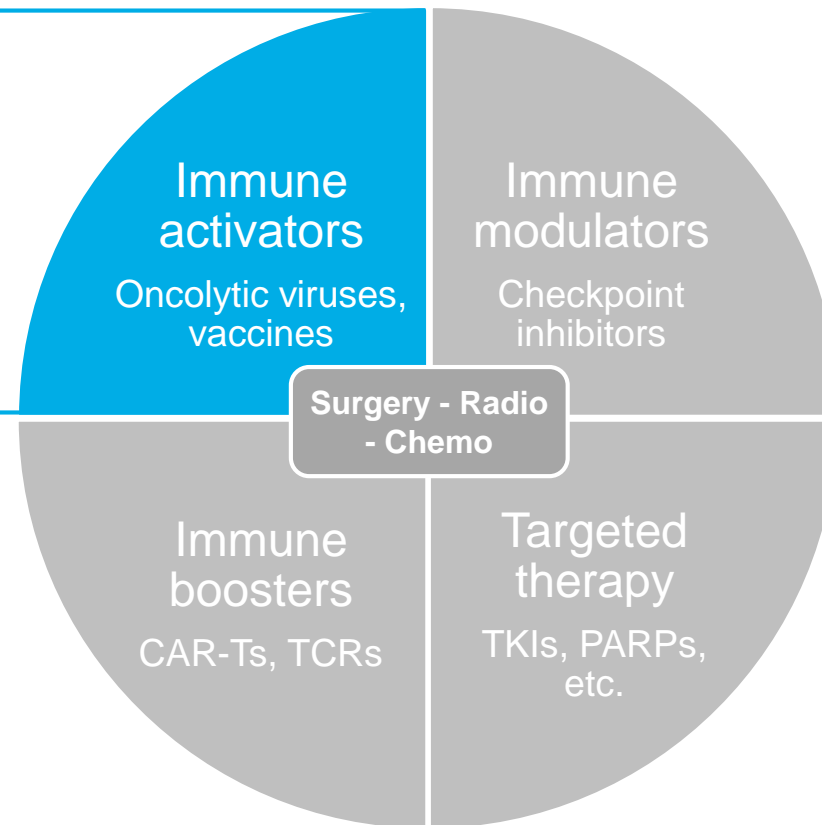

1

Introduction

2. A vaccine approach to target mutant RAS
3. TG clinical data
4. Summary & conclusions

TARGOVAX AIMS TO ACTIVATE THE PATIENT'S OWN IMMUNE SYSTEM TO FIGHT CANCER

Targovax
focus

TARGOVAX HAS TWO CLINICAL STAGE IMMUNE ACTIVATOR PROGRAMS

ONCOS
Oncolytic virus

- Genetically **armed adenovirus**
- Turns cold **tumors hot**
- Induces **tumor specific T-cells**
- Single agent **phase I completed**
- **4 ongoing combination trials**

TG
Neoantigen
vaccine

- **Shared mutant RAS neoantigen** therapeutic cancer vaccine
- Triggers **T-cell responses** to oncogenic **RAS driver mutations**
- 32 patient **phase I/II trial completed**

*Activates the
immune system*

*Triggers patient-
specific responses*

*No need for
individualization*

2

A vaccine approach to target mutant RAS

- 3. TG clinical data
- 4. Summary & conclusions

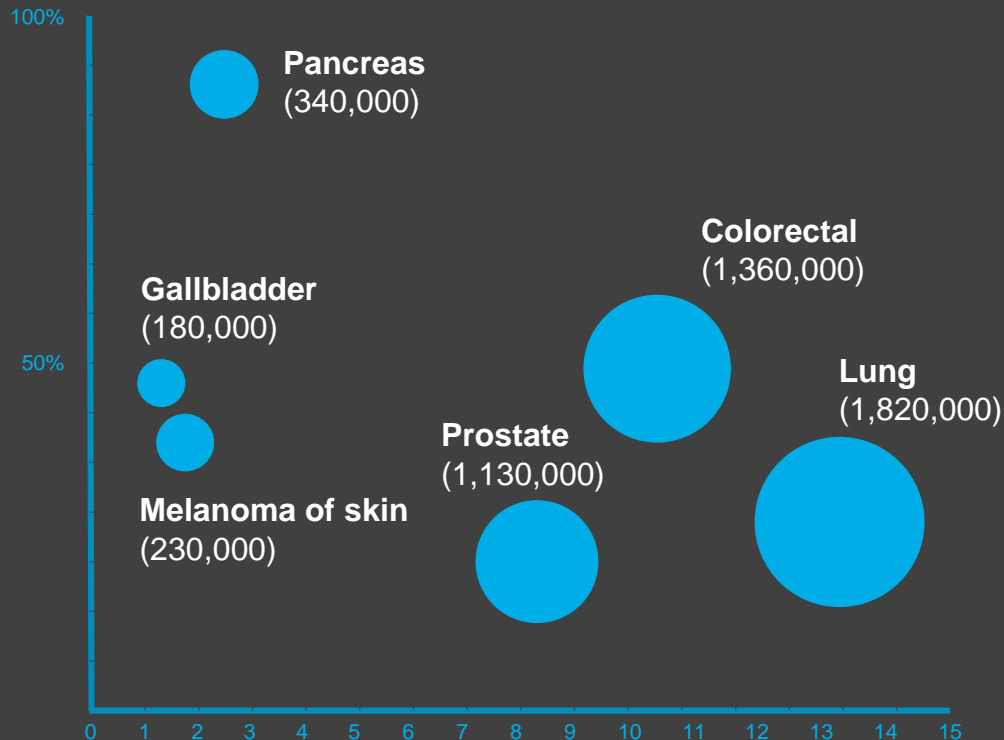

THE RAS GENE IS MUTATED IN 25-30% OF ALL CANCERS

Including 90% of pancreatic and 40% of colorectal cancers

Frequency of RAS mutations

Global cancer incidents per 10,000

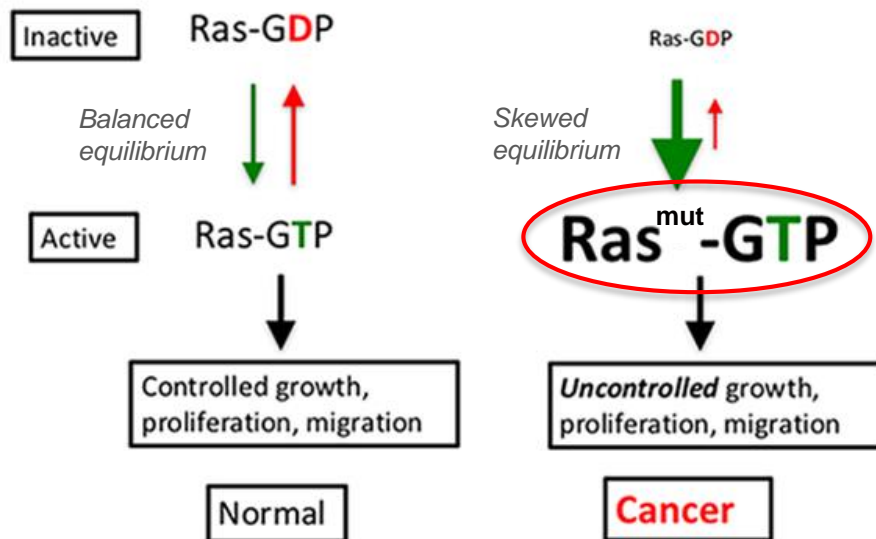

(xx) = no. of cancer patients

- RAS is the **most frequently** occurring **driver mutation**
- RAS is a **clinically validated shared neoantigen**
- Mutant RAS has potential as a future **“genetic marker”** indication

RAS “THE UNDRUGGABLE TARGET”

Oncogenic RAS mutations are key drivers behind uncontrolled cell division

Why is RAS such an elusive target?

- Very high **similarity** between **mutant and wild-type RAS**
- Multiple point **mutation variants**
- Smooth protein surface and **tight binding pocket**
- **Intracellular localization**

RAS is potentially an excellent target for an off-the-shelf cancer vaccine approach

Neoantigen prevalence

- RAS is the **most frequently mutated oncogene family** across all cancers
- RAS is a **true driver mutation**, present on all sub-clones of RAS driven cancers

Neoantigen quality

- RAS produces distinct, recognizable **surface presented neoepitopes**
- Activated T-cells can **detect mutant RAS**

Neoantigen immunogenicity

- RAS-specific T-cells can **occur spontaneously in patients**
- RAS-specific T-cells are **cytotoxic *in vitro***

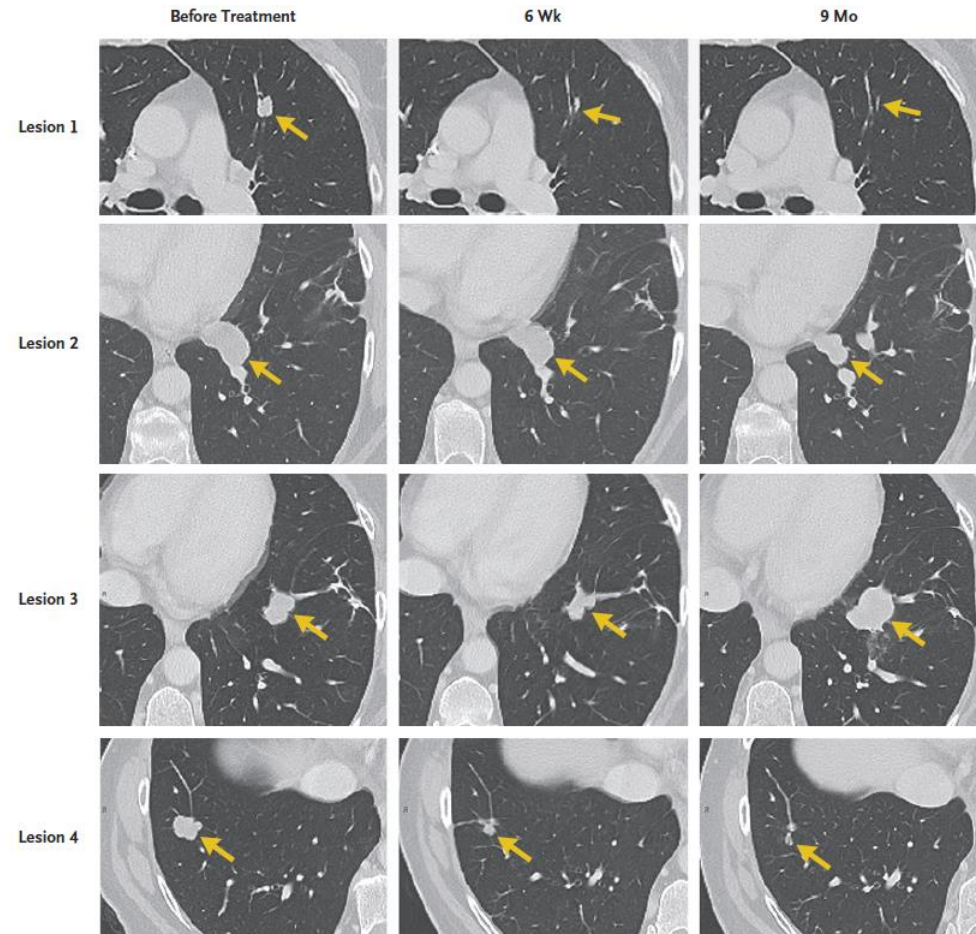

Mutant RAS T-cells can form spontaneously in patients, and recognize and destroy tumors

Rosenberg, A. et. al, (2016), *New England Journal of Medicine: T-cell transfer therapy targeting mutant KRAS in cancer*

Key results

- The patient had **7 lung metastases** that all had **objective regressions** (pictured on right)
- One lesion (#3) progressed after 9 months of therapy, due to **loss of the HLA locus**
- **Proof-of-concept for spontaneous T-cell response** to mutant RAS in patients

THE RAS DEVELOPMENT LANDSCAPE

Company	Asset/ Program	Mechanism of Action	Highest Phase
 GLOBEIMMUNE	 GI-4000/Tarmogen	Heat-inactivated yeast expressing target RAS mutations	Phase II (halted)
 targovax	 TG01 / TG02	Peptide vaccine targeting 7/8 codon 12 & 13 RAS mutations	Phase II
 Silenseed	 siG12D-LODER	RNAi (siRNA) targeting mutant RAS (G12D)	Phase II
 AMGEN	 AMG510	Small molecule inhibitor of RAS (G12C)	Phase I
 MIRATI THERAPEUTICS	 MRTX849	Small molecule inhibitor of RAS (G12C)	Phase I
 moderna	 mRNA4157	mRNA vaccine targeting 4 codon 12 RAS mutations	Phase I
 GILEAD  Kite	 KRAS TCR	Engineered T-cell receptor targeting RAS (G12D)	Phase I
 AstraZeneca  Janssen	 AZD4785	Antisense RNA RAS inhibitor (mutation independent)	Phase I (halted)
 wellspring biosciences  Janssen	 ARS3248	Small molecule inhibitor of RAS (G12C)	Phase I ready
 SANOFI	 Compound-B	Small molecule inhibitor of RAS (G12C)	Preclinical
 REVOLUTION MEDICINES	 NA	Small molecule inhibitor of RAS	Preclinical
 COTINGA PHARMACEUTICALS	 COTI219	Small molecule inhibitor of RAS	Preclinical
 elicio THERAPEUTICS	 ELI002	Small molecule inhibitor of RAS (G12V)	Preclinical
 NEONC TECHNOLOGIES, INC.	 NEO214	Small molecule inhibitor of RAS	Preclinical
 Allinky BIOPHARMA	 AIK4	Small molecule inhibitor of RAS	Preclinical

Targovax TG vaccine is a peptide cocktail designed to induce T-cell responses to RAS driver mutations

1. Activate immune system

- TG peptide cocktail **injected intradermally** with GM-CSF as adjuvant

2. Induce mutRAS T-cells

- **Mutant RAS T-cells activated** by DCs in lymph nodes

3. Attack the cancer

- mutRAS T-cells identify and **destroy mutant RAS cancer cells**

The TG peptide cocktail covers ~99% of all codon 12 and 13 RAS mutations

Oncogenic codon 12 & 13 RAS mutations

1
MTEYKLVVVGAG^{12 13}VGKSALTQLIQ

Wild-type RAS amino acid sequence, with mutation sites in red

TG product characteristics

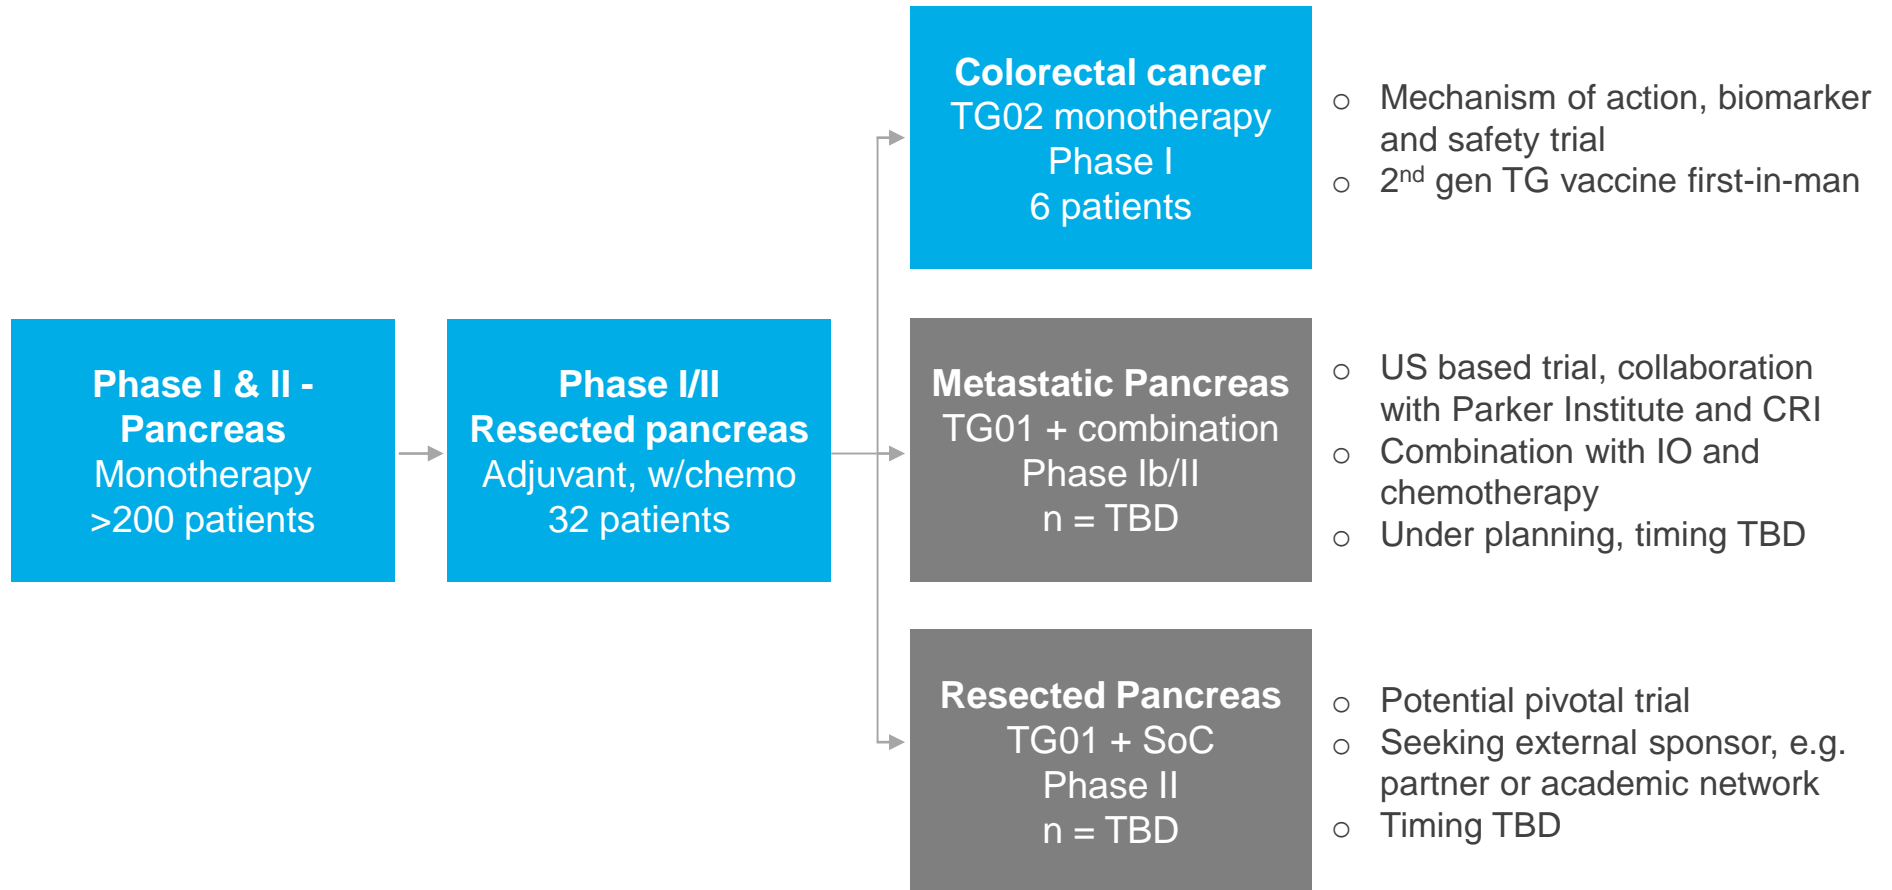

- **Two clinical stage products**
 - **TG01:** 7 peptides covering ~99% of RAS mutations in pancreatic cancer
 - **TG02:** 8 peptides covering ~99% of mutations in NSCLC and CRC
- Covers **all 3 RAS family isoforms** (K, N, & H)
- **Long peptides** (17mer) generating both **CD4+ and CD8+ responses**
- **Promiscuous HLA class II binders**, covering all HLA DR, DP and DQ epitopes
- **All possible class I mutRAS epitopes covered** within sequences (after antigen processing)

3

TG Clinical data

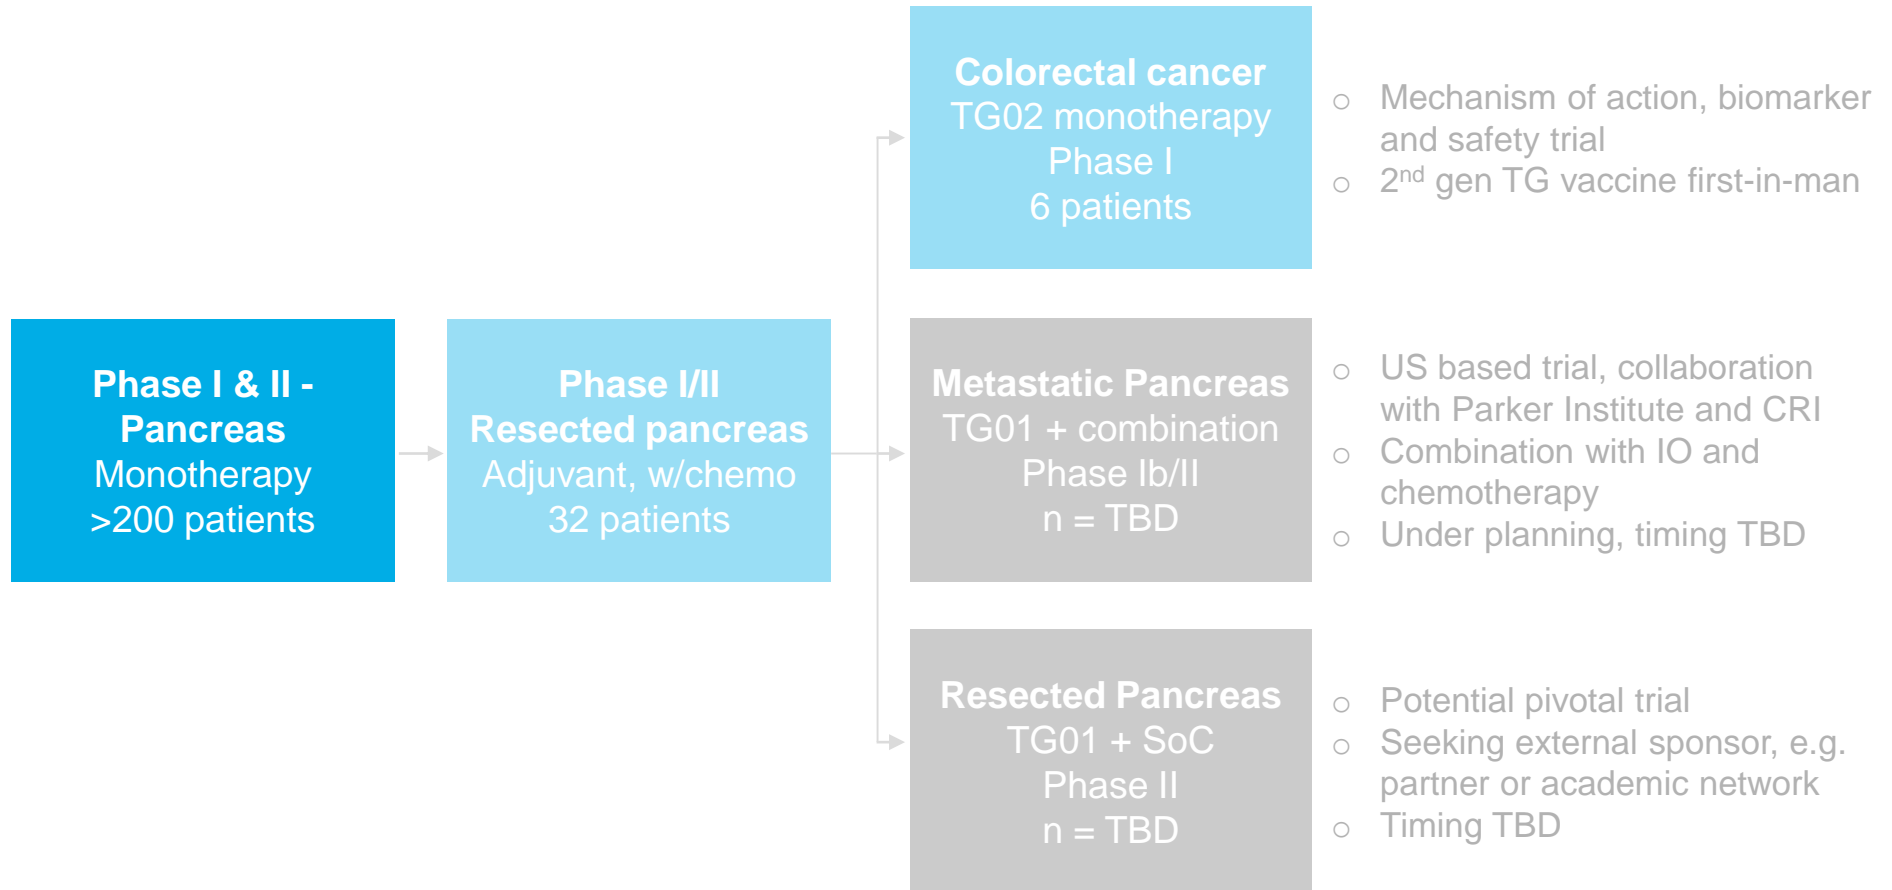

4. Summary & conclusions

TG CLINICAL PROGRAM OVERVIEW

■ Completed trials ■ Trials under planning

TG CLINICAL PROGRAM OVERVIEW

■ Completed trials ■ Trials under planning

TG vaccination induced CD4+ and CD8+ mutant RAS T-cell responses has been validated in patients

mutRAS specific CD4+ T-cells isolated from vaccinated patient

- CD4+ T-cell clone lyse cancer cells isolated from the same patient (*in vitro* cytotoxicity assay)

mutRAS specific CD8+ T-cells isolated from vaccinated patient

- CD8+ T-cell clone lyse cancer cells isolated from the same patient (*in vitro* cytotoxicity assay)

mutRAS specific T-cell clones identified both in blood and tumor

- T-cell clone matching the patient's mutation (G12R) was found in tumor biopsy

Flow cytometric analysis (FACS) showing same clonality of T-cells from PBMC and tumor

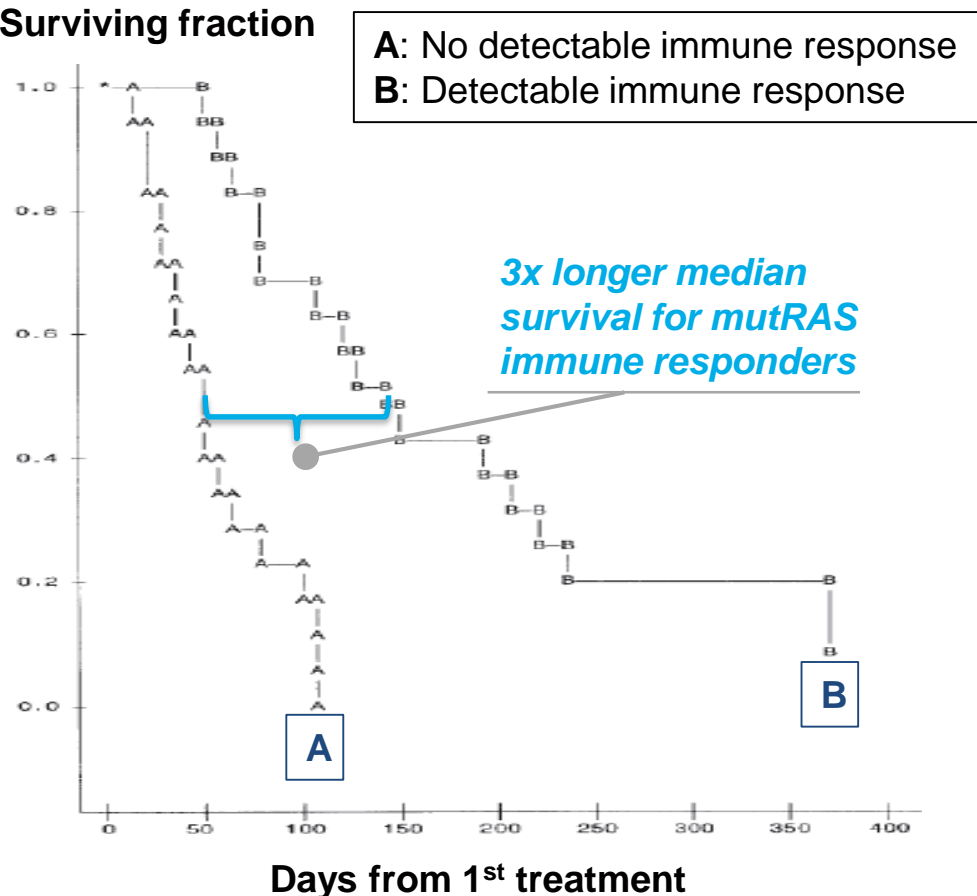

T-cells specific for other RAS mutations than 12R were found in PBMC, but not in tumor

Improved survival for mutRAS immune responders observed in advanced pancreatic cancer patients

Clinical study in advanced pancreatic cancer (36 patients); Cocktail of 4 (of 7) TG01 peptides

Surviving fraction

- 19 of 36 (52%) patients had mutRAS immune response
 - Immune response measured as mutRAS specific skin DTH test, and mutRAS specific T cell proliferation in blood
- 3x longer median survival for responders
 - 144 days for immune-responders (n=19)
 - 48 days for non-responders (n=17)

PHASE I MONOTHERAPY SURVIVAL DATA

TG vaccination showed 20% 10 year survival in resected pancreatic cancer

10 year survival in historical TG trials in resected pancreatic cancer¹

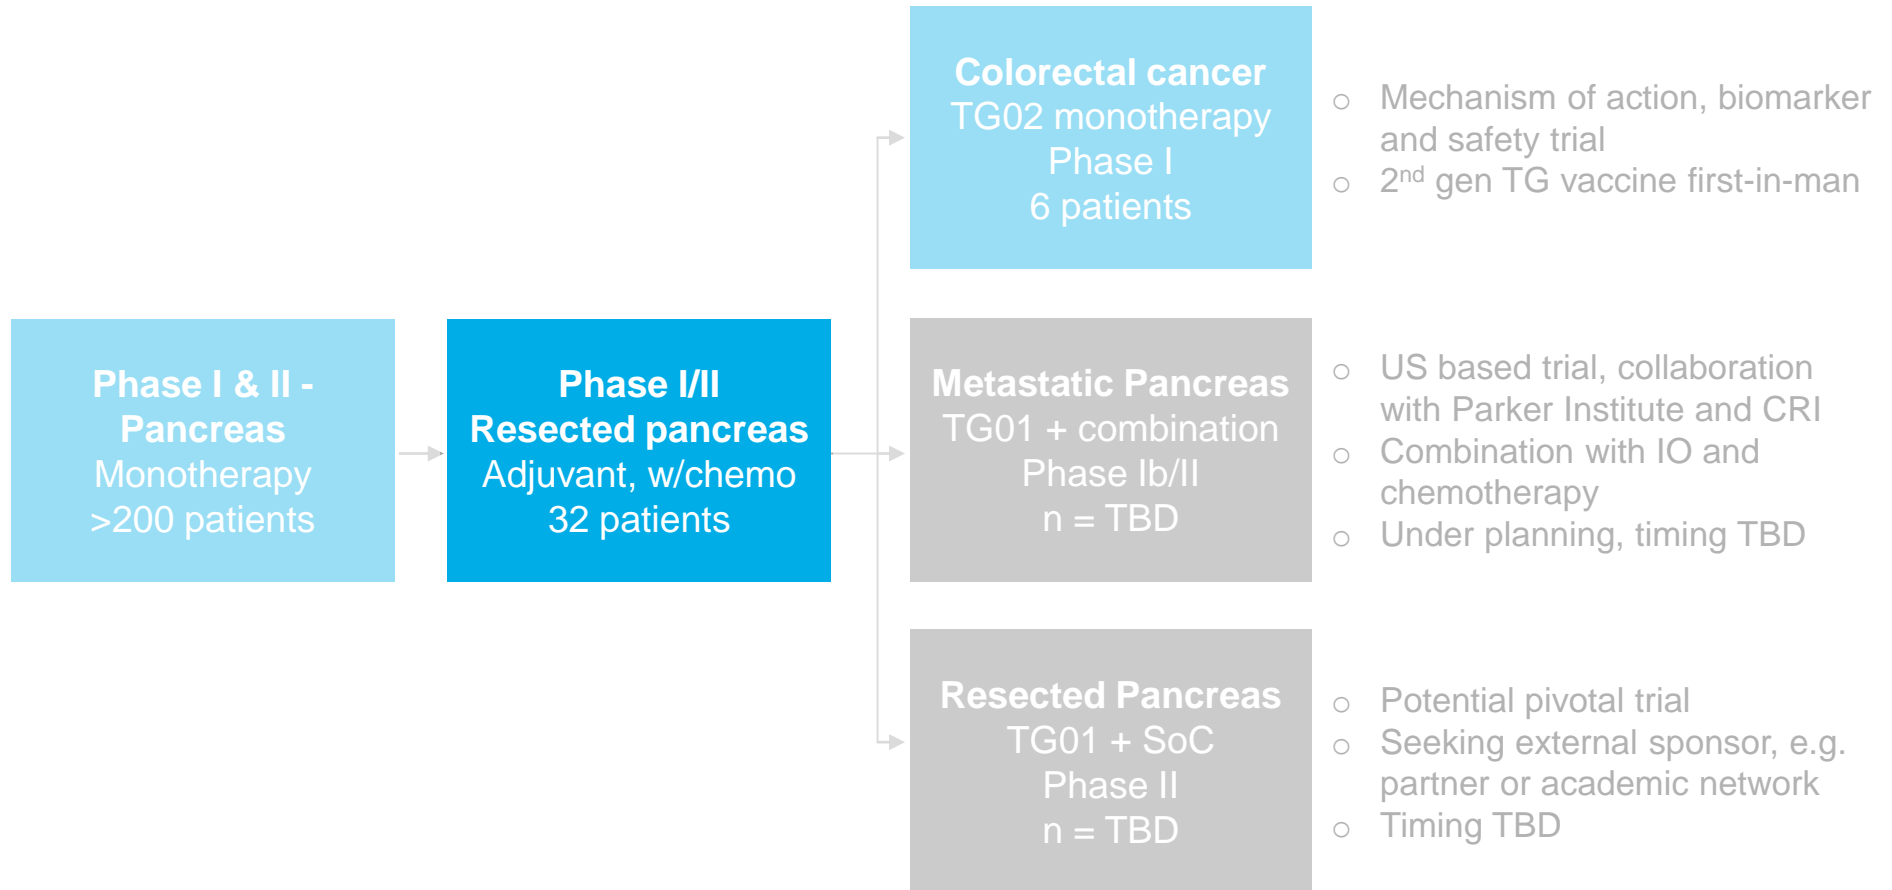

n=20, resected patients from two clinical trials, TG monotherapy

¹ Wedén et al., 2011

² Oettle H et al., JAMA 2013, vol 310, no 14

TG CLINICAL PROGRAM OVERVIEW

■ Completed trials ■ Trials under planning

TG01 – RESECTED PANCREAS STUDY SCHEMA

Phase I/II trial combining TG01 with adjuvant gemcitabine, 32 patients

Patient population	Resected adenocarcinoma of the pancreas and candidates for adjuvant chemotherapy	Treatment	TG01 / GM-CSF (up to 2 years) Gemcitabine (6 cycles)
Objective	Assess safety , mutant RAS immune response and clinical efficacy	Study design	Single arm , open label with safety lead-in 2 cohorts with different dosing regimens

Study cohorts

Treatment schedule

30/32 patients in the trial were confirmed as mutant RAS, with most showing presence of multiple point mutations

Patient RAS status
wt/mut genetic RAS ¹

Number of different RAS mutations detected
qPCR detection of RAS point mutations in cfDNA

¹ RAS status determined by tumor biopsy and/or cfDNA

² Eleven patients were not screened for individual mutations

Company data, unpublished

12D and 12V were the most frequently occurring RAS mutations found in the patients

Frequency of individual RAS point mutations detected in cfDNA¹

Number of patients (%) with mutation confirmed in cfDNA for at least one time point in study (n=21)

- **12D and 12V mutations** co-occurred in **17/21 (81%)** of patients
- **12C mutation** was only detected in **one patient**
- In **one patient** all **six assessed RAS mutations** were detected during the course of the study
- Presence of specific **mutations shifted over time**, indicating selection pressure for specific mutant RAS clones

¹ Eleven patients were not screened for individual mutations in cfDNA
Company data, unpublished

TOP-LINE DATA SUMMARY TG01 + GEMCITABINE

as adjuvant combination treatment in resected pancreatic cancer

1

**RAS-specific
immune activation**

2

**Median disease free
survival, months**

3

**Median overall
survival, months**

TG01 is well-tolerated - improved dosing regimen in second cohort

First cohort: 19 pts, Second cohort: 13 pts. Total 32 pts.

DFS both cohorts combined: 16.1 months

European Society for Pancreatic Cancer ESPAC4 trial data for gemcitabine monotherapy arm (2017), data adjusted to reflect time from surgery

1

RAS specific immune response confirmed in 30 out of 32 patients

Parameters	1 st Cohort (n=19)	2 nd Cohort (n=13)	Overall (N=32)
<i>Immune responder*</i>	18 (95 %)	12 (92 %)	30 (94 %)
DTH Positive (skin hypersensitivity test)	18 (95 %)	8 (62 %)	26 (81 %)
mutRAS Specific T-cells (PBMC proliferation assay)	14 (74 %)	12 (92 %)	26 (81 %)

* Immune responder defined as positive DTH test or PBMC proliferation assay for at least one time point

1

Robust levels of DTH and PBMC mutant RAS immune responses in study

Overall positive DTH responses during study
number of patients per group

26/32 total positives
81%

Overall positive PBMC responses during study
number of patients per group

26/30 total positives
87%

1 DTH and PBMC mutant RAS immune responses increased over time

DTH responses over time

% of analyzed patients with positive DTH at each time point

PBMC responses over time

% of analyzed patients with positive PBMC at each time point

Measured 4/8 weeks after last cycle of chemotherapy ** EoS time point varies between patients
 Baseline response prior to first vaccination (week 1), not defined as positive immune response to TG
 Company data, unpublished

2

Disease free survival (DFS) Kaplan-Meier plot

Censored= No progression on latest scan collected

DFS was measured from surgery

Company data, unpublished

3

Kaplan-Meier survival plot for all 32 patients - signal of clinical benefit of TG vaccination

3 TG01 resected pancreas trial - swimmer plot showing individual patient outcomes

* RAS wild type (2/32 patients)

All measurements in months from surgery

Company data, unpublished

3

Multiple RAS mutations detected in cfDNA in most patients, and evidence of clonal clearance following TG vaccination

- *RAS mutations changed over time*
- *All mutations cleared at last time point*
- *Patient alive at 4 years*

- *Mutational load reduced (only one possible mutant left at EoS)*
- *Patient alive at 5 years*

- *One mutation at baseline, cleared by cycle 2*
- *Multiple clones re-emerged by cycle 5/6*
- *Tumor recurred at 20 months*

4

Summary & conclusions

SUMMARY – TG MUTANT RAS VACCINE

Targets all RAS mutations with one product

- Covers **99%** of codon 12 and 13 oncogenic **RAS mutations**
- Patients frequently have **multiple RAS mutation clones** present

Promising immune response and efficacy data

- **Signal of survival benefit** in resected pancreatic cancer
- Mutant RAS **T-cell responses** in **>90%** of vaccinated patients
- **Clearance of mutant RAS clones** in cfDNA

Potential as genetic marker “pan-RAS” vaccine

- Mutant RAS found in **25-30% of all solid tumors**
- First examples of **genetic marker approvals** already given by **FDA**
- **Excellent tolerability**, with broad potential for IO and chemo combinations

Available for partnering

- **Combination trials, novel adjuvants** and delivery strategies
- Global or regional **licensing, asset unencumbered**
